

# MOLD IN YOUR MINI SPLIT SYSTEM

It's a disgusting problem, yet it is a common one. Ductless Mini Split systems can be filled with dirt, debris and mold if they are not properly maintained.

Left ignored, the inside of your ductless mini split could look like this! A ductless unit like this puts mold spores into the air you breathe, making problems for your home and your health.

## 5 SIGNS OF A MINI SPLIT MOLD PROBLEM

- A bad odor that smells perhaps like a dirty sock or something cheesy
- Black or odd-colored splotches on the wall unit, visible when lifting the cover on the air handler
- Finding a lot of moisture or standing water beneath your mini split
- Having increased difficulty with respiratory problems
- Experiencing more allergy-like symptoms inside your home

# HOW TO PREVENT MOLD PROBLEMS

## KEEP YOUR MINI SPLIT TURNED ON

The best way to prevent future mold problems is by NOT immediately turn off the system when you don't need it. Mini splits don't cycle on and off. Instead, they often run in the background in a low-power mode. Not only is it maintaining the temperature, but it's also draining moisture. When you turn the system off unexpectedly, that moisture stays put.
